

Forward and Backward Pass of Convolutional layers

Jong-Chyi Su, 3/2/2018

Forward pass - 1D case

$$y_1 = w_0 * x_0 + w_1 * x_1 + w_2 * x_2 + b$$

$$y_2 = w_0 * x_1 + w_1 * x_2 + w_2 * x_3 + b$$

$$y_3 = w_0 * x_2 + w_1 * x_3 + w_2 * x_4 + b$$

Backward pass - 1D case

How to compute dw_0 ?

Backward pass - 1D case

$$dw_0 = dy_1 * x_0 + dy_2 * x_1 + dy_3 * x_2$$

Backward pass - 1D case

$$dw_1 = dy_1 * x_1 + dy_2 * x_2 + dy_3 * x_3$$

Backward pass - 1D case

$$dw_2 = dy_1 * x_2 + dy_2 * x_3 + dy_3 * x_4$$

Backward pass - 1D case

$$dw_0 = dy_1 * x_0 + dy_2 * x_1 + dy_3 * x_2$$

$$dw_1 = dy_1 * x_1 + dy_2 * x_2 + dy_3 * x_3$$

$$dw_2 = dy_1 * x_2 + dy_2 * x_3 + dy_3 * x_4$$

This is the convolution of Y and X

Backward pass - 1D case

Now compute dx

Backward pass - 1D case

$$dx_1 = \quad + dy_1 * w_1 + dy_2 * w_0$$

Backward pass - 1D case

$$dx_2 = dy_1 * w_2 + dy_2 * w_1 + dy_3 * w_0$$

Backward pass - 1D case

$$dx_3 = dy_2 * w_2 + dy_3 * w_1$$

Backward pass - 1D case

$$dx_1 = dy_1 * w_1 + dy_2 * w_0$$

$$dx_2 = dy_1 * w_2 + dy_2 * w_1 + dy_3 * w_0$$

$$dx_3 = dy_2 * w_2 + dy_3 * w_1$$

Backward pass - 1D case

$$dx_1 = dy_1 * w_1 + dy_2 * w_0$$

$$dx_2 = dy_1 * w_2 + dy_2 * w_1 + dy_3 * w_0$$

$$dx_3 = dy_2 * w_2 + dy_3 * w_1$$

This is convolution of Y and flipped filter W !

Backward pass - 1D case

How about db?

$$y_1 = w_0 * x_0 + w_1 * x_1 + w_2 * x_2 + b$$

$$y_2 = w_0 * x_1 + w_1 * x_2 + w_2 * x_3 + b$$

$$y_3 = w_0 * x_2 + w_1 * x_3 + w_2 * x_4 + b$$

Backward pass - 1D case

$$db = dy_1 * 1 + dy_2 * 1 + dy_3 * 1$$

Sum over dY

Now back to 2D case

Always check dimension first:

$X \rightarrow (N, C, H, W)$

$W \rightarrow (F, C, H_f, W_f)$

$b \rightarrow (F)$

$Y = W * X + b \rightarrow (N, F, H_{out}, W_{out})$

where $H_{out} = (H + 2 * pad - H_f) / stride + 1$

Now consider only one image and one channel
One filter with size 3x3, input size 5x5

Dimensions:

$X \rightarrow (N, C, H, W) \rightarrow (1, 1, 5, 5)$

$W \rightarrow (F, C, H_f, W_f) \rightarrow (1, 1, 3, 3)$

$b \rightarrow (F) \rightarrow (1)$

$Y = W * X + b \rightarrow (N, F, H_{out}, W_{out}) \rightarrow (1, 1, 3, 3)$

$H_{out} = (H + 2 * pad - H_f) / stride + 1 = (5 + 0 - 3) / 1 + 1 = 3$

Compute dX

What locations in y are connected to x_{22} ?

Backward pass - 2D case

Compute dX

What locations in y are connected to x_{22} ?

Like 1D case, you can do convolution between Y and inverted W

Backward pass - 2D case

Compute dX

What locations in y are connected to x_{00} ?

Backward pass - 2D case

Compute dX

What locations in y are connected to x_{00} ?

Backward pass - 2D case

Compute dX

What locations in y are connected to x_{00} ?

You can use zero-padding for Y first when computing dX

Backward pass - 2D case

Compute dW

Which x and y pairs are computed using w_{01} ?

x_{00}	x_{01}	x_{02}	x_{03}	x_{04}

y ₃₁	y ₃₂	y ₃₃

Y 3*3

Summary

- 1. Always check dimensions**
- 2. Pad input X first**
- 3. Remove the padding after dX is calculated**
- 4. You can also add padding for dY for backward pass**
- 5. Add channels**
- 6. Add stride**
- 7. Add batch**
- 8. You can use convolution on backward pass (with flipping)**
- 9. There are multiple ways to implement, e.g. you can use many for loops over each location**

Why do we use convolutional layers?

- 1. share filters, fewer weights in the model**
- 2. Convolution filters are useful for image processing**
